Hypermed	ia Document Desig	gn		

Some Issues:

- Hypermedia Document Requirement:
 - time constraints
 - spatial constraints
 - user interactions
- Live Design
- Designer, publicist and journalist: limited knowledge in computing

Drawback

 Undesirable behaviors introduced during the creation of document

Introduction	The Proposed Design Method	Formal Verification	Toolchain 0000000	Conclusions 00000

Design S	Solutions			
Usual	Solution			
• T	est of all possible behavi	ors		

- A lot of work, costly
 - Non-exhaustive
 - Inappropriate in live editions (due to the time required)

Proposed Solution: Three-step method based on verification

- Modeling/Edition:
 - Hypermedia languages (NCL and SMIL)
- 2 Transformation:
 - From Hypermedia Document language to Formal Verification Model
- Verification
 - Model-checking: checking properties which represent desired behaviors

Introduction 000000	The Proposed Design Method	Formal Verification	Toolchain 0000000	Conclusions

Introduction	The Proposed Design Method	Formal Verification	Toolchain	Conclusions
○○○○○●	000000	000000000	0000000	00000
Main Challenges				

1- Time Relationships Verification

Detection of undesirable behaviors originated from temporal relationships, and also remote control actions.

2- Spatial Relationships Verification

Guarantee of media display on the appropriate presentation region.

3- Live Editing

Verification on-the-fly with admissible response time.

4- Application Design Facilities

Friendly environment for designers without expertise on formal models.

Design N	lethod			

1- Modeling Step

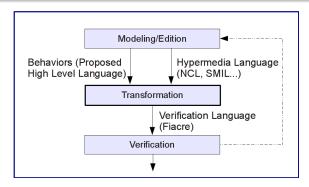

- Application written in hypermedia languages (NCL or SMIL).
- Desired Behaviors written in High Level Property Language.

Introduction	The Proposed Design Method	Formal Verification	Toolchain	Conclusions
000000	00●000		0000000	00000
Design M	lethod			

2- Automatic Transformation Step Using a MDE Approach

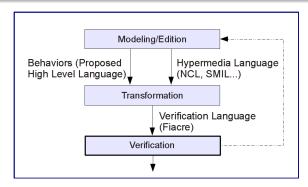

- From Hypermedia Application to Formal Verification Language (FIACRE).
- From High Level Property Language to LTL formula and FIACRE Observers.

Introduction	The Proposed Design Method	Formal Verification	Toolchain	Conclusions
000000	000●00		0000000	00000
Design Method				

3- Verification Step (Model-checking Principles)

- Unsatisfied property → counterexample (sequence of actions corresponding to the non-satisfaction of the property).
- Counterexample helps the designer to fix the application errors.

Transforr	mation Step			

Transformation Rules: **From** Designer Representation **to** Verification Representation

From Hypermedia Language

- Media (dynamics of the media)
- 2 Link between Medias
- Ossible User Interactions
- High Level Property
- I High Level Property

To FIACRE Language

- Fiacre Process
- Isiacre Glue Process
- Fiacre Remote Control Process
- Fiacre Observer with time + LTL formula
- ITL formula

Verificatio	n			

Behaviors can be checked in two ways:

- LTL formulas
 - when they consider only occurrence of events
- Observers and LTL formulas
 - when they measure the elapsed time between events
 - when they consider the cause of an event

Observers capture events occurring in the Hypermedia System

Introduction 000000	The Proposed Design Method	Formal Verification	Toolchain 0000000	Conclusions 00000
Observers				

Temporal Observer:

- The figure shows the basic observer which identifies the elapsed time between the arrival of the *begin_obs* and *end_obs* messages:
 - **(**) end1: *elapsed time* $< t_{min}$
 - 2 end2: $t_{min} \leq elapsed$ time

Introduction 000000	The Proposed Design Method	Formal Verification	Toolchain 0000000	Conclusions 00000
Observers				

Global Time Observer- identifies a precise time when something occur.

- Aiming discretize the passage of time, the observer changes its state every second.
- Adopted in the analysis of counterexamples.

Time Ver	ification			

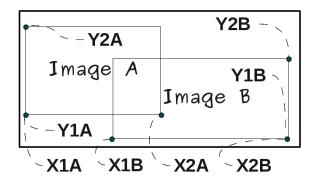

Only LTL formulas/Observers and LTL formulas

- Intramedia relationships- checks exhibition and time limits
- Intermedia relationships- checks all Allen's relationships, as:
 - (a) B-start after A-start
 - (b) *B*-stop after *A*-stop
 - (c) A overlapping B

Introduction 000000	The Proposed Design Method	Formal Verification	Toolchain 0000000	Conclusions 00000
Spatial V	erification			

• **Spatial** - checks full or partial spatial overlap of object or screen regions

Verificatio	on in Practice			

Application "Live Longer"

- Erroneous behavior- menu displayed out of human visual perception
- Intramedia Property- when presented, media *menu_Dish1* always remains visible for a minimum time observable by perceptible human vision
 - The property to check the vision time, is represented by *ob_menu_Dish*1 observer

- the observer's behavior is verified by LTL formula:
- $\Box(ob_menu_dish1_running \Longrightarrow (\neg(\Diamond(ob_menu_dish1_end1))))$
- The result is "False"

Introduction 000000	The Proposed Design Method	Formal Verification	Toolchain 0000000	Conclusions 00000
Counterex	ample			

Counterexample media *menu_dish*1

- The time between **running** and **stopped** states is less than the minimum required.
- Erroneous behavior- *menu_dish*1 displayed out of human visual sense

Line	Time	Media	States
1	74	menu_Dish1	Stopped
2	74	menu_Dish1	Running
3	75	menu_Dish1	Stopped

- This table is part of a graphical interface, generated after the verification process.
- The Time column is generated from the Global Time Observer.

Introduction 000000	The Proposed Design Method	Formal Verification	Toolchain 000€000	Conclusions
2- Trans	formation Hyperme	dia to IG Grau	ch	

IG Graph:

- Allows use of graph theory in the reduction process
- Add new Hypermedia language to the verification chain
- MDE Transformation model-to-model (M2M): transforms from NCL application to Intermediary Graph (IG)
- Transformation rules coded in ATL language

J |

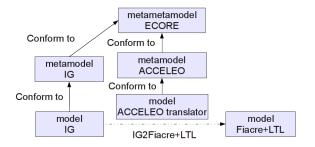

Introduction 000000	The Proposed Design Method	Formal Verification	Toolchain 0000●00	Conclusions 00000
3- Reduci	ng IG Graph			

- Goal: reduce the computational cost of the verification process during the **live design**.
- Receives as inputs IG and a set of properties
 - performs reduction for each media and property associated
 - preserves the relevant parts of this graph for checking the desired properties
- Developed in Java

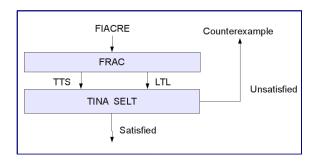

- MDE Transformation model-to-text (M2T): transforms from IG Graph to FIACRE Model
- MDE Transformation model-to-text (M2T): transforms from High Level Properties to FIACRE Properties (LTL)
- Transformation rules coded in ACCELEO language

Introduction 000000	The Proposed Design Method	Formal Verification	Toolchain 000000●	Conclusions 00000
5- Verifica	ation			

- The code in Fiacre is compiled by the FRAC tool generating an equivalent code in TTS and LTL
- SELT, the model checker tool of the TINA toolbox
- SELT allows to verify formulas written in LTL
 - When the formula is unsatisfied, a counterexample is generated to help the designer

Conclusi	ons			

- Proposal and validation of a Design Method
- Development and test of toolchain supporting this Design Method based on MDE
 - Guarantee of coherence between hypermedia model and formal model **MDE**
 - Issues for Hypermedia Document
 - requirement to verify (temporal, causal and spatial)
 - live design (by reduction, decreasing the computational cost)
 - facilities for designer without expertise in verification

Introduction 000000	The Proposed Design Method	Formal Verification	Toolchain 0000000	Conclusions ○○○○●
